Submitted (16-M06-2002) Wellcome Trust Sanger Institute, Hinxton, Cambridgeshire, CB10 1SA, UK. E-mail enquiries: zface@sanger.ac.uk clone requests: clonerequest@sanger.ac.uk clone requests: clonerequest@sanger.ac.uk clone syl, 2002 this sequence version replaced gi:20268901.

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations corresponding to the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with mail overlap as described above.

The following
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AL672211

S0828 bp DNA linear VRT 16-AUG-200
Schraftsh DNA sequence from clone BUSM1-6A2 Contains a novel gene
similar to CGFR, a novel OGFR pseudogene, two pseudogenes on a
novel LINE-like transposon, a novel reverse transcriptase
speudogene, the fez gene for forebrain embryonic zinc-finger
procein, part of a novel gene for a protein similar to Ca2+
dependent activator and four CpG islands, complete sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Eukaryota, Metazoa, Chordata; Craniata, Vertebrata, Euteleostomi,

abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em:, EMBL; Sw., SWISSPROT; Tr.: TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at
                                                                                                                                                                                                                                                                                                                                   Repeat names beginning 'Dr' were identified by the Recon repeat discovery system (Zhirong Bao and Sean Eddy, submitted), and those beginning 'dr' were identified by Rick Waterman (Stephen Johnson lab, WashU). For further information see http://www/Projects/D_rerio/fishmask.shtml his clone was isolated from a PAC library (Incyte Genomics, Inc.) and provided by G. Levkowitz (Genentech Inc., San Francisco, USA). This sequence is the entire insert of clone BUSM1-6A2 The true left end of clone BUSM1-13 is at 44958 in this sequence.

McPherson, Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see http://genome.wustl.edu/gsc
University, 4444 Forest Park Avenue, St. Louis, Missouri 63108, USA On Feb 16, 2002 this sequence version replaced gi:18250125.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The RPCI-11 human BAC library was made from the blood of one male donor, as described by Osoegawa, K., Woon, P.Y., Zhao, B., Frengen, B., Tateno, M., Catanese, J.J. and de Jong, P.J. (1998) An improved approach for construction of bacterial artificial chromosome libraries. Genomics 51:1-8. The clone may be obtained either from Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong
                                                                                                                                                                                                                                               NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                                                                                                     This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality date (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   NEIGHBORING SEQUENCE INFORMATION:
The clone sequenced to the left is RP11-252K7, 2000 bp overlap.
Actual start of this clone is at base position 106699 of
RP11-252K7; actual end is at base position 126118 of RP11-182K3.

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       2189 idcgiadaaracaacrccgricagaracraarararaaracrirraaaaacarararrig 2130

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511) expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins

The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, ADDS, eppliepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.

Novel nucleic acid useful

for diagnosis and

therapy

of behavioral

```
The invention relates to nucleic acids comprising a segment of chemically pretreated DNA of adrenergic alpha-1C-receptor gene. The invention also betalates to oligonuclectides or peptide nucleic acid (PNA) oligomers useful for detecting cytosine methylations. The pretreated DNA is useful for the diagnosis or therapy of behavioural disorders, neurological disorders and cancer, in particular major depressive disorder, Tourette's syndrome, schizophrenia, psychiatric and neurological disorders, smoking, drug abuse, alcoholism, personality traits, compulsive gambling, human and schizoaffective patients, and suicidal behaviours in schizophrenic and schizophrenia. The nucleic acid is useful for detecting the methylation state of all CpG dinucleotides and/or single nucleotide polymorphisms (SNPS). The present sequence is human chemically treated genomic DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                3147 Archaattraacccaaarcraactaariccaaaacccarcritraarcrarara 3088

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleocides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For c example, they may be used to treat disorders associated with decreased expression by recttifying mutations or delations in a patient's genome c that affect the activity of (I) by expressing inactive proteins or to c supplement the patients own production of (I). Additionally, (I) c polynucleotides may be used to produce the secreted (I), by inserting c the nucleic acids into a host cell and culturing the cell to express the correctin. (I) proteins and polynucleotides may be used to prevent, c diagnose and treat immune/haematopoletic-related diseases, especially cancers and cancer metastases of haematopoietic-derived cells. (HUMA-) HUMAN GENOME SCI INC

Rosen CA, Barash SC, Ruben SM;

WPI; 2001-483426/52.

Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis -

Disclosure; SEQ ID NO 39112; 3071pp + Sequence Listing; English.

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I)

amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic
acituity, and can be used in gene therapy and vaccine production. (I)
acituity, and can be used in gene therapy and vaccine production. (I)
treatment of diseases associated with inappropriate (I) expression. For
example, they may be used to treat disorders associated with decreased
cytostation by rectifying mutations or deletions in a patient's genome
that affect the activity of (I) by expressing inactive proteins or to
cytostation by rectifying mutations of (I). Additionally, (I)
cytostation by be used to produce the secreted (I), by inserting
the nucleic acids into a host cell and culturing the cell to express the
cytotein. (I) proteins and polynucleotides may be used to prevent,
cancers and cancer metastases of haematopoietic-derived cells. AK64703
cc to AAK87694 represent human immune/haematopoietic antigen genomic
c sequences from the present invention. AAK5492 to AAK6750 and AAM82169

ABL34024

```
AAKS4951 to AAK64702 encode the human immune/haematopoietic antigen (I)

c amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic
activity, and can be used in gene therapy and vaccine production. (II)
correction and polynucleotides may be used in the prevention, diagnosis and
ct reatment of diseases associated with inappropriate (I) expression. For
example, they may be used to treat disorders associated with decreased
c expression by rectifying mutations or deletions in a patient's genome
that affect the activity of (I) by expressing inactive proteins or to
c that affect the activity of (I) by expressing inactive proteins or to
c supplement the patients own production of (I). Additionally, (I)
c supplement the patients own production of (I). Additionally, (I)
c polynucleotides may be used to produce the secreted (I), by inserting
cc the nucleic acids into a host cell and culturing the cell to express the
protein. (I) proteins and polynucleotides may be used to prevent,
c protein. (I) proteins and polynucleotides may be used to prevent,
c diagnose and treat immune/haematopoietic-related diseases, especially
cc cancers and cancer metastases of haematopoietic-derived cells. AAK64703
cc cancers and cancer metastases of haematopoietic antigen genomic
c to AAK87694 represent human immune/haematopoietic antigen genomic
c represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and

The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukeamia, Alzheimer's disease, Alls, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2241 Trirringrahdarrarrarrarrargecederrirrarrarrarrarrarrarga 2300

                                                                                                                                                                                                                                                                                                                                                                     RESULT 11
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a nucleic acid comprising a sequence of 18 cc bases, of a segment of chemically pretreated DNA (CP DNA) e.g. with CC bisulphite, of genes associated with tumour suppression and concogenes having a sequence taken from 536 (actually 533 since CC numbers 408, 458 and 500 are missing from the sequence listing) sequences (SS) and sequences complementary to (SS). The nucleic acid may be a peptide nucleic acid-oligomer (PNA) of at least 9 nucleotides and may CC form part of a set of probes for detecting the cytosine methylation state and/or single nucleotide polymorphisms and also to be used in an CC array for analysing diseases associated with CpG dinucleotides e.g. CC cancers and tumours. The probes can also be used in a method for assertaining genetic and/or epigenetic parameters for the diagnosis of diseases, by analysing cytosine methylations. The parameters may be compared to another set of genetic and/or epigenetic parameters, the creates serving as basis for diagnosis and/or prognosis events which care disadvantageous to patients. The present sequence is one of the parameters and compared to another set of genetic and/or spigenetic parameters, the compared to another set of genetic and/or spigenetic parameters may be a proposed to another set of genetic and/or spigenetic parameters and the compared to another set of genetic and/or spigenetic parameters and the compared to another set of genetic and/or spigenetic parameters and the compared to another set of genetic and/or spigenetic parameters and the compared to another set of genetic and/or spigenetic parameters and the compared to another set of genetic and/or spigenetic parameters and the compared to another set of genetic and/or spigenetic parameters and the compared to another set of genetic and/or spigenetic parameters and the compared to another set of genetic and/or spigenetic parameters and the compared to another set of genetic and/or spigenetic parameters and the compared to another set of genetic and/or spigenetic paramete
                                                                                                                                                                                                                                                                     Matches

                                                                                                                                                                                                                                                                                                           CC signal transduction associated genes. The DNA sequences are chemically C modified using a solution of bisulphite, hydrogen sulphite or Cd disulphite. Also disclosed are oligonuclectides and/or PNA oligomers CC for detecting the cytosine methylation state (CpG islands) of these CC genes, and a method for the diagnosis and/or therapy of genetic and CC epigenetic parameters of genes associated with signal transduction. CC The genomic DNA can be obtained from cells or cellular components which CC contain DNA, e.g. cell lines, biopsies, blood, sputum, stool, urine, CC cerebral-spinal fluid, tissue embedded in paraffin such as tissue from CC eyes, intestine, kidney, brain, heart, prostate, lung, brasst or liver, CC ciscases associated with signal transduction e.g. solid tumours and CC diseases associated with signal transduction e.g. solid tumours and CC cancer. ABK31158-ABK31545 represent chemically pretreated genomic DNA CC sequences of different genes associated with signal transduction, or their romalementary emembersa

The present invention describes an isolated dysferlin DNA of 20-25

Tucleotides in length, comprising a nucleotide sequence specifically selected from nucleotides 11-913, 929-948, 1019-1038, 1392-1411, 1014-1038, 1392-1411, 1014-1038, 1398-1317, 1352-1371, 1241-1433, 1484-1503, 1499-1518, 1543-1565, 1715-1734, 1714-1759, 1714-1734, 1484-1503, 1499-1518, 1543-1565, 1715-1734, 1714-1759, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-1739, 1714-17

This invention describes a novel human dysferlin nucleic acid (I) and its encoding protein (II), which has anti-dystrophic activity and can be used for gene therapy. Introduction of (I), a vector comprising (I) or dysferlin into a cell of a mammal can be used to decrease the symptoms of muscular dystrophy. The dysferlin gene is normally expressed in skeletal hereditary muscular dystrophies, e.g. Miyoshi myopathy and limb girdle muscular dystrophies, e.g. Miyoshi myopathy and limb girdle muscular dystrophies and oligonucleotides derived from (I) can be used in diagnosis of or risk identification for dysferlin-related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       disorders in patients, fetus, or pre-embryos. Expression of brain-specific dysferlin may be important as a marker for normal neural development. Dysferlin DNA or subgenomic coding sequences can be used for therapy of the hereditary muscular dystrophies. This sequence represents a fragment of the human dysferlin gene described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel dysferlin genes and related proteins useful for diagnosis, risk identification and treatment of hereditary muscular dystrophies and other dysferlin related disorders -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0; Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                      polynucleotide of the invention. The polynucleotides of the invention are all secreted EST sequences isolated from a variety of human tissue sources. The EST sequences and proteins encoded by them are predicted to have useful biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, immune stimulating or suppressing activity, haemastopoiesis regulating activity, tissue growth activity, haemostatic activity haemostatic activity, haemostatic
                                                                                                                                                                                                                                                                                                                                                                         and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, cadherin/tumour invasion suppressor activity, tumour inhibition activity. The EST sequences are also stated to be useful for gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New polynucleotides encoding human secreted proteins - derived from e.g. human blood, kidney, foetal lung, placenta, testes, brain, ovary, pituitary, retina and colon cDNA libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Expressed sequence tag; secreted protein; haematopoiesis regulator; tissue growth; activin; inhibin; tumour invasion suppressor; EST; human; chemotaxis; chemokinesis; haemostasis; gene therapy; thrombolysis; receptor; ligand; anti-inflammatory; tumour inhibitor; ds.

                                                                                                                                                                                                                                                                                                   The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invent useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL016176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins

Sequence 5, Application US/09362642
Patent No. 6350935
GENERAL INFORMATION:
APPLICANT: Bennett, Alan B.
APPLICANT: Rose, Jocelyn K.C.
APPLICANT: The Regents of the University of California
TITLE OF INVENTION: Fruit Specific and Ripening Regulation Expansin Genes
FILE REFERENCE: 023070-078210US
CURRENT APPLICATION NUMBER: US/09/362,642
CURRENT FILING DATE: 1999-07-27
NUMBER OF SEQ ID NOS: 8

                                                                               GENERAL INFORMATION:
APPLICANT: Yamanouchi Pharmaceutical Co., Ltd.
TITLE OF INVENTION: A novel potassium channel protein
FILE REFERENCE: Y9903-PCT
CURRENT APPLICATION NUMBER: US/09/600,776
CURRENT FILING DATE: 2000-07-21
PRIOR APPLICATION NUMBER: JP P1998-011434
PRIOR RILING DATE: 1998-01-23
PRIOR RILING DATE: 1998-12-04

Sequence 2, Application US/09754853A

PUBLICANT NO. US20030005491A1

GENERAL INFORMATION:
APPLICANT: Hauge, Brian M.
APPLICANT: Parnell, Laurence D.
APPLICANT: Wang, Ming Li
TITLE OF INVENTION: Nucleic Acid Molecules And Other Molecules Associated With
TITLE OF INVENTION: Soybean Cyst Nematode Resistance
FILE REFERENCE: 38-10(15810)8

CURRENT APPLICATION NUMBER: US/09/754,853A

CURRENT FILING DATE: 2001-01-05

PRIOR PAPLICATION NUMBER: US 60/174,880

PRIOR PLICATION NUMBER: US 60/174,880

NUMBER OF SEQ ID NOS: 1119

/note="0rgan: shoot tips; Vector: Lambda TriplEx; Site_1: Sfil (B); Shoot tips (approx. 2 cm from apex) were collected during the spring, frozen and used for mRNA isolation. The SNART-PCR method (clontech) was used to prepare a library from 1 ug total RNA, using the Lambda TriplEx vector: Plasmid subclones in pTriplEx were recovered by cre-lox excision in E. coli strain BM25.8 and sequenced from the 5' end."
